

Analytic Geometry (Classic Reprint)

This book is written for the purpose of furnishing college classes with a thoroughly usable textbook in analytic geometry. It is not so elaborate in its details as to be unfitted for practical classroom use; neither has it been prepared for the purpose of exploiting any special theory of presentation; it aims solely to set forth the leading facts of the subject clearly, succinctly, and in the same practical manner that characterizes the other textbooks of the series. It is recognized that the colleges of this country generally follow one of two plans with respect to analytic geometry. Either they offer a course extending through one semester or they expect students who take the subject to continue its study through a whole year. For this reason the authors have so arranged the work as to allow either of these plans to be adopted. In particular it will be noted that in each of the chapters on the conic sections questions relating to tangents to the conic are treated in the latter part of the chapter. This arrangement allows of those subjects being omitted for the shorter course if desired. Sections which may be omitted without breaking the sequence of the work, and the omission of which will allow the student to acquire a good working knowledge of the subject in a single half year are as follows: 46-53, 66-62, 121-134, 145-163, 178-197, 225-245, and part or all of the chapters on solid geometry. On the other hand, students who wish that thorough foundation in analytic geometry which should precede the study of the higher branches of mathematics are urged to complete the entire book, whether required to do so by the course of study or not.
