

Climate Change and Agriculture in India: Studies from Selected River Basins

This book provides an overview of climate change in India using river basin data and analytical and econometric methods. It, first, makes a quantitative assessment of how climate change affects agricultural and food production systems; second, predicts how these systems may respond to climate change; and third, suggests adaptation measures and strategies to improve the income of farmers, increase production, save water and conserve environment. The work will be greatly useful to policy-makers, researchers and teachers of agricultural economics, environmental studies and economics and development studies as also to research organizations dealing with climate modelling and resource management.
