

Ecology of TEHRI DAM

Life on earth is available in different forms with water in its basic structure. Availability of water on earth is abundant but major portion is salty water. In comparison the freshwater resources are very less and pressure on them is continuously increasing. Reservoirs are one of the major sources of freshwater on earth, no matter whether they are man-made or nature but counted a freshwater ecosystem affecting the health, economy and environment of local area. Due to their importance we need to study their quality and monitor them on regular basis so that we can make available our natural resources to our coming generations. Even in ancient times people are aware about the importance of freshwater. In the ancient literature we have plenty of literature available describing how the important steps have been taken up by the kings to conserve the ponds, lakes, talabs, etc. and to store rain water which otherwise went to oceans as run-off.
