

## Geographic Information Systems: Proceedings of the Institutions of Civil Engineers (Issue 2 1996 v. 114)

Computer-based geographic information systems (GIS) have become a powerful new tool in the civil engineering industry for the organisation and analysis of spatial data. They are particularly important now that survey data can be collected so quickly and accurately using the global positioning system (GPS). This special colour issue of ICE Proceedings contains a suite of seven refereed papers written by leading experts in the field. It provides a comprehensive introduction to GIS and GPS and reviews their practical applications in civil engineering, including major projects such as the Channel Tunnel Rail Link.
